

SPEC-DRIVEN INTERVIEWS

From Requirements Gatherer to Product Specialist.

Too many software projects fail because of vague user stories, missing edge cases, and architectural misalignment. The **Spec-Driven Business & Product Mastery** volume provides a rigorous, engineering-minded framework to translate business goals into unambiguous, executable specifications.

In this book, you will master:

- * **Spec-Driven Requirements Engineering:** Write robust specifications with defined pre-conditions, post-conditions, invariants, and edge cases.
- * **API & System Design Literacy:** Speak the same language as developers by mastering HTTP methods, status codes, Swagger/OpenAPI specs, and basic system architecture.
- * **Advanced Process Modeling:** Design precise business workflows using BPMN 2.0 and state transition machines that eliminate ambiguity.
- * **Data-Driven Analysis:** Write advanced SQL queries to analyze customer usage data and extract key metrics for product decisions.
- * **AI-Augmented Product Management:** Leverage AI systems to validate specifications, generate edge cases, and optimize your agile backlog.

Designed for professionals who want to bridge the technical divide, assert product leadership, and ace their next technical interview.
