

SPEC-DRIVEN INTERVIEWS

From Test Executor to Quality Partner.

The modern software engineering landscape is moving away from reactive QA testing towards proactive, specification-driven quality partnerships. The **Spec-Driven Quality Engineering** volume is the definitive guide for SDETs, QA leads, and engineering managers who want to transition from basic test execution to designing advanced quality gates.

In this book, you will master:

- * **The SDDSD-POD Model:** Learn how to embed Quality Partners directly with developers in high-performance pairing loops.
- * **Advanced Automation & Tooling:** Design scalable, resilient test frameworks using Playwright, Selenium, and API contract testing (Pact/Postman).
- * **Performance & Security Testing:** Establish performance benchmarks with k6 load testing, and security baselines with OWASP ZAP.
- * **CI/CD Shift-Left Pipelines:** Construct automated quality gates in GitHub Actions that prevent regressions from ever hitting production.
- * **Executive Quality Leadership:** Learn how to communicate test metrics to business leaders and manage production incident post-mortems.

Equip yourself with the tools, architectural depth, and leadership frameworks needed to command your next engineering interview.
