

SPEC-DRIVEN INTERVIEWS

From Requirements Gatherer to Product Specialist.

Too many software projects fail not because of coding errors, but because of vague user stories, undocumented edge cases, and misalignment between business goals and engineering execution. Writing simple "As a user, I want..." tickets is no longer enough for complex, scale-driven enterprise systems.

The **Spec-Driven Business & Product Mastery** volume provides a rigorous, engineering-minded framework to translate business goals into unambiguous, executable specifications. You will learn to move beyond basic requirements gathering and transition into a "Product Specialist" who defines precise system invariants, state machines, and API schemas.

In this book, you will master:

- * **Spec-Driven Requirements Engineering:** Write robust specifications detailing pre-conditions, post-conditions, invariants, and edge cases that eliminate ambiguity.
- * **API & System Design Literacy:** Learn to read and write schemas, HTTP methods, status codes, and Swagger/OpenAPI specifications to align with engineering architectures.
- * **Advanced Process Modeling:** Construct precise business workflows using BPMN 2.0 and state transition diagrams to discover gaps before coding begins.
- * **Data-Driven Analysis:** Master advanced SQL queries to analyze usage patterns, check data integrity, and draw metrics directly from database layers.
- * **AI-Augmented Product Management:** Leverage AI workflows to validate specifications, generate edge cases, and maintain a highly optimized backlog.

Designed for professionals who want to bridge the technical divide, assert product leadership, and ace their next technical interview.
