

SPEC-DRIVEN INTERVIEWS

From Test Executor to Quality Partner.

The modern software engineering landscape is moving away from reactive QA testing towards proactive, specification-driven quality partnerships. The **Spec-Driven Quality Engineering** volume is the definitive guide for SDETs, QA leads, and engineering managers who want to transition from basic test execution to designing advanced quality gates.

In this book, you will master:

- * **The SDSD-POD Model:** Transition from reactive QA to a proactive Quality Partner role, embedding 1:1 pairing loops with developers in agile delivery teams.
- * **Advanced Automation & Tooling:** Design scalable, decoupled test architectures using Playwright, Selenium, and API contract testing (Pact and Postman).
- * **Performance & Security Baselines:** Build robust load-testing suites with k6 and run automated security vulnerability sweeps using OWASP ZAP.
- * **Continuous Integration (CI/CD) Gates:** Program automated gates in GitHub Actions to catch and isolate regressions before they merge.
- * **Executive Quality Leadership:** Communicate key risk and quality metrics to business stakeholders, design disaster recovery strategies, and run blameless post-mortems.

Equip yourself with the tools, architectural depth, and leadership frameworks needed to command your next engineering interview.
